

IBA's FULL-BAC Teat Dip was evaluated in comparison to Bovadine® (registered trademark of West Agro, Inc.) under conditions of experimental challenge, following the guidelines recommended by the National Mastitis Council. No differences were seen in the number of new intramammary infections for *Staphylococcus aureus* or *Streptococcus agalactiae* over a 10-week study period between IBA's FULL-BAC and Bovadine®. Teat skin and teat end condition scores were statistically evaluated at weeks one, five and nine of the study period, and no significant differences were observed between the two products*. The bottom line is IBA's FULL-BAC Teat Dip measures up to Bovadine® in both efficacy and teat conditioning.

Because the above study was conducted during the early summer months, a time when the teat condition is normally less of a concern than during the late fall and winter months, IBA plans further testing in the harsh weather months and feels confident that its new and advanced skin conditioning package and technology will yield superior results to any other product currently on the market.

SUMMARY: IBA's FULL-BAC possesses all of the qualities that top dairyman demand in a Teat Dip. From outstanding efficacy, to superb teat conditioning, to exceptional pre-dip performance, to rich color and finally to excellent product stability, FULL-BAC will become the product of choice on many dairies.

Simply put, no other teat dip combines all of the above features and benefits into one product.

WHAT IS FULL-BAC?

FULL-BAC is a highly effective Pre and Post Milking Teat Dip featuring a full 1% iodine and 12% skin conditioners.

WHAT IS SO SPECIAL ABOUT THIS 1% IODINE AS AN ACTIVE INGREDIENT?

This particular 1% iodine formulation incorporates the latest innovations in iodine stabilization technology. In short, a stronger product for a longer period of time. In addition, it has highly effective levels of “free” iodine for superb germicidal activity and efficacy.

WHAT IS SO SIGNIFICANT WITH REGARD TO THE 12% SKIN CONDITIONERS?

First, a 12% skin conditioning package far exceeds the amount of skin conditioners found in the vast majority of other Teat Dips. Second, the 12% cosmetic/emollient system incorporated into FULL-BAC Teat Dip is unique to IBA and no other competitive product even comes close to this new and advanced combination of ingredients. Remember, healthy teats and teat ends that are free of cracks, lesions and irritation are the cows best defense mechanism against mastitis.

ARE THERE ANY INGREDIENTS IN FULL-BAC THAT WOULD HELP MAKE IT A SUPERIOR PRE-DIP?

Yes. Besides having an iodine complex that’s on the “cutting edge” and a superior skin conditioning package, FULL-BAC Teat Dip contains extra levels of cleaning and wetting agents that will cut through any soils and debris on teats and teat ends, thus, speeding-up the pre-dip routine while actually cleaning the teats better.

ARE THERE ANY OTHER BENEFITS ASSOCIATED WITH THE USE OF IBA’S FULL-BAC TEAT DIP?

Yes. The dark, rich color of FULL-BAC “paints” the teat evenly and uniformly so dairyman can readily observe whether or not the teat dip was properly applied to the herd. Last, but not least, a special array of buffering agents and surfactants have been added to keep the pH of the product from drifting and to keep it from settling out in extreme cold or hot temperatures.
